

Site Evacuation SOP

Document No: SOP-EMG-002 | Category: Emergency | Revision: 3 | Effective Date: 2026-01-15 | Review Cycle: Annual

1. Purpose

This SOP defines the procedure for the safe and orderly evacuation of all personnel from the facility in response to fire, chemical release, structural damage, bomb threat, natural disaster, or any other emergency requiring immediate building clearance.

2. Scope

Applies to all employees, contractors, and visitors at the facility, across all shifts, and covers evacuation from office areas, production floors, warehouses, and outdoor work areas.

3. Evacuation Triggers

- Activation of the fire alarm system.
- Verbal or visual instruction from a fire warden, supervisor, or security personnel.
- Detection of a chemical or gas leak by fixed gas detectors or personal monitors.
- Structural damage such as visible cracking, collapse risk, or earthquake.
- A confirmed bomb threat or other security emergency communicated by the Site Emergency Coordinator.

4. Evacuation Routes and Exits

Each work area has at least two clearly marked emergency exit routes, illuminated by photoluminescent or battery-backed exit signage, kept unobstructed at all times. Evacuation route maps are posted at key locations throughout the facility showing the nearest exits and the designated assembly point for that zone. Employees must familiarize themselves with the routes for their work area during induction and whenever routes change.

5. Evacuation Procedure

- On hearing the alarm or instruction, stop work immediately and do not attempt to collect personal belongings.
- Proceed calmly, without running, to the nearest available exit, using stairs — never lifts or elevators.
- Assist any person with a disability or mobility limitation, or alert a fire warden to provide assistance via the designated evacuation chair if applicable.
- Move directly to your zone's designated assembly point, remaining together with your immediate work team where practical to aid headcount.
- Do not return to the building for any reason until the All Clear is announced by the Site Emergency Coordinator.

6. Assembly Point and Headcount

Each department has a pre-assigned assembly point located at a safe distance from the building, clear of vehicle access roads. Department supervisors or fire wardens conduct a headcount

against the shift attendance register immediately upon arrival and report the results, including any missing personnel, to the Site Emergency Coordinator without delay.

7. Visitor and Contractor Management

All visitors and contractors are signed in at the security gate and issued a visitor badge recording their host and work area. During an evacuation, hosts are responsible for guiding their visitors to the assembly point and confirming their presence during headcount. Security maintains the master visitor log at the main assembly point for cross-verification.

8. Special Considerations

Areas with hazardous processes (chemical handling, high-temperature furnaces) have additional shutdown steps that must be completed within the time permitted before evacuation, as defined in area-specific emergency shutdown checklists; these steps must never delay evacuation beyond the time limit specified for that area. Night shift and weekend evacuations follow the same procedure with the on-duty supervisor assuming Site Emergency Coordinator responsibilities.

9. Drills, Training, and Review

Full-facility evacuation drills are conducted at least twice annually, and after any significant change to building layout, staffing, or exit routes. Drill performance, including total evacuation time and any bottlenecks observed, is documented and reviewed by the EHS committee, with corrective actions tracked to closure. All employees receive evacuation training during induction and annual refreshers.
